

Executive Summary

Care Transition Efficiency & Placement Outcome Analytics

Coverage: 2023-01-12 to 2025-12-21 | 720 valid reporting rows

Purpose

This project gives government stakeholders a practical way to monitor whether children are moving efficiently through the care pipeline from CBP custody to HHS care and then to discharge or sponsor placement.

Headline Results

- Total apprehensions recorded: 67,337.
- Total transfers out of CBP custody: 92,641.
- Total HHS discharges / placements: 124,853.
- Average transfer efficiency ratio: 69.1%.
- Average discharge effectiveness index: 2.4%.
- Worst rolling 14-day HHS backlog period ended 2024-05-02 with 1,100 net cases.

Policy Interpretation

The full-period totals suggest that discharges exceeded transfers overall, but this does not eliminate operational risk. The most important risk appears during sustained short-term imbalances, when transfers into HHS care outpace discharges and unresolved cases accumulate.

Dashboard Capabilities

- Date-range filtering
- Ratio-based KPI toggles
- Transfer and discharge efficiency panels
- Bottleneck charts
- Threshold-based visual alerts
- Monthly and weekday outcome analysis

Recommended Actions

- Institutionalize rolling backlog monitoring.
- Set operational thresholds for low transfer and discharge performance.
- Investigate months and weekdays with repeated imbalance.
- Use stability scoring to detect placement volatility before large backlogs become visible.
